Week 1

1. print("Hello, World") → prints 'Hello, World' to the screen.
2. print("Hi", "Hello") → print several things separated by space.
3. print() → print empty line
4. print('=' * 34) → prints "=" 34 times.
5. print("Hi\n\there\tpeople") → \n inserts newline, \t inserts
6. Anything after # is ignored by python and not executed. Called COMMENTS.
7. name = "Sandesh" → making a variable called 'name' with
   print(name) value being the string "Sandesh".
   ↳ prints "Sandesh"
8. variable types:

Type	Means
str	text
int	whole number
float	number with decimal point

print type using:
print(type(variable_name))

9. name = "John"
   name = "Sandesh"
   ↳ variable name's value is reassigned.

10. Operators (arithmetic):

symbol	operation
+	addition
-	subtraction
*	multiplication
/	division (float)
//	whole division
%	modulus
**	exponentiation

11. order of operations:

1. **
2. *, /, //, % (left-to-right)
3. +, -

12. count += 1 -> count = count + 1
13. record_id = input("Record ID: ")

inputs a record_id from user. Always returns a string

14. convert one type to another: casting

e.g: num = "8"
num = int(num)

- put f before quotes, then any variable in {} to add variable to string:

```
record = "R-004"
print(f"Record: {record}")
```
