Week 2:

1. Comparison operators:

2. Conditionals:

```
value = 70

if value == 70:
    print("is 70")
```

prints 70 because value is indeed 70. would not work if value was something else

```
if value == 70:
    print("is 70")
else:
    print("is not 70")
```

if not: 70, it prints "is not 70".

```
value = 65

if value==70:
   print("is 70")
elif value==65:
   print("is 65")
else:
   print("neither 70 nor 65")
```

prints "is 65". 'elif' is literally 'else if'.

3: While loop:

```
while <condition>:
    do something
```

does something while condition is True. Condition must eventually become False or the code runs forever.

4. ~~while~~ For i in range(a, b, step):

- a: initial number (included)
- b: end number (not included)
- step: difference in each value

5. indentation:

indicates code is part of a block

```
if condition:
    print('hi')
```

↳ indentation
